About Me

As a computer engineering graduate ranking 3rd in the Faculty of Technology and 2nd in my department, I have aligned my technical focus on integrating Computer Vision and Deep Learning models into cloud infrastructures throughout my studies, and I continue to advance my expertise in these fields. During my undergraduate years, I gained hands-on experience in the automation and deployment of AI-based operational processes based on Docker, CI/CD pipelines, DevOps, and MLOps principles. I combine this strong academic foundation with leadership and communication skills developed through technology community leadership and project management roles. I am a dynamic engineer who quickly adapts to the operational requirements of complex projects, takes responsibility in technical processes, and thrives in collaborative team environments.

Education

Selçuk University

Computer Engineering GPA: 3.75/4

September 2021 – June 2026

Experiences

Huawei Türkiye

Regional Leader

September 2025 – Present

- Manages and supervises six HSD embassies in the Central Anatolia region, supporting their management processes and activities.

Huawei Türkiye

Intern

July 2024 – July 2025

- Developed custom CLI tools and Bash scripts to automate development workflows and improve efficiency. Gained hands-on experience in managing containerized environments using Docker on Linux systems, while maintaining seamless version control and collaboration through Git.

Divizyon

Software Program Manager Assistant

December 2024 – October 2025

- Served as a Program Manager Assistant in software development projects utilizing Agile and Scrum methodologies. As a Center of Excellence (CoE) representative, I actively participated in sprint planning, daily scrums, and retrospectives, driving the adoption of agile standards and best practices across multiple teams.

Huawei Türkiye

Campus Ambassador

August 2024 – September 2025

- Organized trainings and events as a Huawei Campus Ambassador at HSD Selçuk University, gaining management skills through the establishment and coordination of project teams.

Technical Skills

Programming Languages

- Python
- .Net
- Node.js

Tools

- Git & GitHub
- Jira & Trello
- Cloud Services/Platforms

Frameworks and Technologies

- OpenCV
- TensorFlow
- Scikit-Learn

Projects

AI-Powered Physiotherapy Application

- Developed an AI-powered physiotherapy mobile application using **Android Kotlin** and **Python/FastAPI** with a dual-role architecture. Implemented real-time pose estimation and movement phase detection by integrating MediaPipe and CameraX on the frontend, enabling automatic joint angle calculations and adaptive repetition counting. Designed a secure **PostgreSQL** database managed via SQLAlchemy and Alembic, and deployed the backend infrastructure as a containerized service using Docker on Easypanel.

HSD Türkiye Website v1

www.hsdturkiye.com

- To determine HSD Turkey's requirements, we conducted a comprehensive needs analysis and developed an ERP platform focused on community management. This platform, which utilizes **.NET Core MVC** architecture on the backend and HTML, CSS, and JavaScript technologies on the frontend, includes all the necessary components for campus ambassadors and community managers to efficiently manage all their administrative processes.

HSD Türkiye Website v2

- Due to the initial version (v1) of the website being closed to community access and lacking modern architectural standards, we developed a new website using **.Net Core Web API** and **Nuxt.js** technologies. We built the project on Huawei Cloud infrastructure, utilizing services such as **VPC, ECS, SWR, RDS, OBS, ELB, and AS**, creating a fully scalable architecture. This allowed us to transition to a modern technology stack while ensuring the project operates in a flexible and high-performance environment.

Image Preprocessing Platform

<https://github.com/osmanbugrabolat/goruntulsleme/tree/main>

- I developed a high-performance image preprocessing platform using Python-based **FastAPI** and **Django**. The platform includes comprehensive algorithmic modules such as spatial transformations, histogram optimization, and the addition and removal of noise models (Gaussian, Salt & Pepper). FastAPI's asynchronous nature ensures low latency in computationally intensive tasks, while Django optimizes system modularity. The project provides an end-to-end technical infrastructure that enables the processing of raw data, preparing it for analysis and deep learning processes.

Dermatological Disease Detection

- Using the Fitzpatrick17k dataset, I developed a skin disease diagnosis model sensitive to different skin types. During the fine-tuning process on the **EfficientNet-B3 architecture**, I integrated custom loss functions to ensure the model not only focuses on the disease but also considers skin type variability. Following the training phase, I deployed the model as an inference service on a **Hetzner** server using FastAPI.
